

CHANGE IDEA: Identify community partners for care coordination and linkage through community asset mapping.

STEP 1: GET READY (TASKS)

- A. Convene a health center planning team, including health care providers, family members, care coordinators, social workers, and administrative staff. See this [sample invitation](#) for a letter or email. It may be helpful to note that this is a multi-step process that may take several months.
- B. Explore existing community assets (e.g., 311 lines, Family Resource Centers, Help Me Grow) as opportunities to strengthen gap areas.
- C. Select 1-3 initial goals for enhancing care coordination through community asset mapping (e.g., improve access to health services, reduce roadblocks to behavioral health care).
- D. Use data to identify high-need areas that require additional resources (e.g., mental health services, substance use treatment, nutrition programs).
- E. Select a Geographic Information System (GIS) community asset mapping tool, such as [QGIS](#), that will allow easy access, updating, and sharing among care coordinators and patients.
- F. Assign roles and responsibilities to manage the asset mapping process and ensure data accuracy.
- G. Provide [training on the asset mapping tool](#).

STEP 2: PLAN AND PRACTICE

Use Geographic Information System (GIS) mapping to identify community partners.

- A. **Identify Relevant Data Sources:** Collect up-to-date data on local services related to mental health, early intervention, housing, nutrition, and transportation. Include recent needs assessments or landscape analyses if available.
- B. **Dialogue With Key Partners:** Meet with key partners to understand services, referral processes, and communication standards to optimize possible “warm handoffs” and reduce missed referrals and follow-up.
- C. **Map Resources:** Use GIS to create a map that includes the following services:
 - Mental health (e.g., counseling, therapy centers, home-based infant mental health)
 - Early intervention (e.g., developmental screening programs, early childhood education programs)
 - Housing assistance (e.g., public housing, housing vouchers, shelters)
- D. **GIS Mapping:** Enter the collected data into the GIS and create separate layers for each service type. Geocode each resource to its geographic location for easy reference.

- E. **Pilot Test:** Test the GIS mapping with a small group of families over a short period of time to evaluate the process of connecting families to community resources.

Evaluation:

- **Data Review:** Evaluate the accuracy of the GIS map by comparing it with existing resource directories. Check for missing services or outdated information.
- **Feedback Collection:** Gather feedback from care coordinators, families, and community partners on usability and effectiveness.
- **Measure Success:** Use key performance indicators to measure:
 - ✓ Number of families connected to services
 - ✓ Referral timeliness and accuracy
 - ✓ Family satisfaction
 - ✓ Stakeholder feedback on GIS usability

Key Questions:

- Were families able to identify available services easily?
- Did the GIS mapping tool accurately reflect available resources?
- Did the tool streamline the referral process?
- Were there any significant gaps in services?
- What language issues arose?

STEP 3: REVIEW AND REFINE

- A. **Evaluate the mapping tool's effectiveness:** Assess how well the community asset map supports care coordination by monitoring patient satisfaction, timely access, and health outcome improvements.
- B. **Gather feedback:** Collect input from care coordinators, families, and staff. Identify areas for improvement, such as missing resources or gaps in the referral process.
- C. **Adjust workflows and tools:** Based on the feedback, refine workflows and update the community resource map to include additional assets or remove outdated information.

STEP 4: EXPAND

- A. **Expand asset mapping to all care coordinators:** Once the mapping tool is refined, expand its use to all care coordinators at the health center. Ensure that every care coordinator is trained and has access to the map.
- B. **Integrate asset mapping into patient intake:** Incorporate questions about needs (e.g., housing, nutrition, transportation) into the patient intake process to ensure care coordinators are aware of these factors from the beginning.
- C. **Develop partnerships with community organizations:** Foster relationships with local organizations and service providers to keep the map current and ensure patients are referred to appropriate resources.

STEP 5: SUSTAIN

- A. **Embed the process into daily operations:** Integrate the asset mapping process into standard operating procedures so care coordination remains a routine.
- B. **Monitor long-term outcomes:** Track long-term outcomes for referred patients, including improvements in health and access to care.

- C. **Share success stories:** Share patient stories with staff and community partners to reinforce the impact of the asset mapping process and build momentum.
- D. **Continuously monitor the effectiveness:** Regularly review the impact of asset mapping on care coordination, focusing on patient access to resources, satisfaction, and health outcomes.
- E. **Make improvements to the map:** Continue adding new community resources and remove outdated ones to keep the map current and user-friendly.
- F. **Gather ongoing feedback:** Solicit regular feedback from care coordinators and patients about how the community asset map is functioning to further refine the process.
